## Frontend Engineer — Design Systems & UI Architecture

TYPESCRIPT · STYLE ENGINES · DX TOOLING · PERFORMANCE · A11Y · TECHNICAL LEADERSHIP

I build the systems other engineers build on. Over *15+ years* I've turned fragmented UI into coherent, high-performance design systems and frontend platforms, working where design intent, render, and developer experience meet.

2026 — PRESENT    OPEN SOURCE

**dunky.dev** 

### DX tools that unlock powerful UIs

A framework-agnostic foundation for design systems that solves the *wiring problem*: behavior and styles scattered across framework-specific code, forcing costly rewrites per platform.

- **State Machine.** Framework-agnostic behavior, described once. *Available.*
- **Style Engine.** Portable style schemas, resolved for performance. *Coming soon.*
- **Components.** Agnostic render layer over behavior and styles. *Coming soon.*

## 01 Experience

---

OCT 2021 — PRESENT    BERLIN

### Tech Lead — Design System

**Miro** · Design System Team

I lead the architecture and evolution of Miro's design system, the shared UI foundation powering web, native and canvas.

- **Styling architecture across surfaces.** Designed and built the design system's styling library into a unified style layer to serve both DOM and canvas — aligned across the performance team, the canvas engine (Miro's in-house JSX-like renderer), and web. A full build-time style extractor compiles authored styles to static CSS, removing runtime cost and meeting the performance budget of the canvas's hottest paths.
- **Component architecture & Radix adoption.** Contributed to building the design system's component library and pioneered the adoption of Radix UI — wrapping primitives, defining the distribution strategy, and establishing how teams consume and extend components. The approach closely mirrored what shadcn/ui would later popularise, long before it existed.
- **Accessibility partnership.** Worked closely with the a11y team to cover their full spectrum of needs — from keyboard navigation and ARIA semantics to screen-reader edge cases. Iterating against non-obvious behaviors that sharpened both the components and my understanding of real-world assistive-technology constraints.
- **Figma to code.** Led the effort to organize and automate the icon library pipeline from Figma to code, and the design token distribution from Figma through DS packages — keeping design and code continuously in sync across consumers.
- **AI-ready design system.** Drove the move to an AI-ready pipeline where a single source flows packages to docs and MCP
- **Architecture & platform migration.** Stays current with the industry to keep the system on the right tools at the right time — adopted Stitches when the design system needed fast adoption and first-class design-token support, then architected the move away from it after deprecation, ensuring long-term maintainability without disruption.

- **Footprint reduction & governance.** Researched and identified an ~83% reduction opportunity in Miro's CSS bundle size – formed and led a cross-team initiative to close that gap, handing the design system full styling control over the app, enforced with CSS handlers that block ad-hoc overrides of components and keep the UI consistent everywhere.
- **Automation.** Built visual-regression automation to catch UI drift before release, and automated the icon pipeline end-to-end from Figma to code.

AUG 2019 – OCT 2021 BERLIN

## Staff Software Engineer

Cobalt.io · Frontend Chapter Lead

Led the frontend chapter across four teams, setting technical direction from data fetching through to UI rendering for Cobalt's pentest-as-a-service platform.

- **Modular design system.** Built and scaled a modular design system that let four teams ship consistent UI independently and in parallel.
- **Ownership model.** Defined ownership boundaries and interfaces between frontend teams, removing overlap and unblocking parallel delivery.
- **Visual-regression testing.** Introduced a Jest + Puppeteer pipeline for automated UI validation, cutting regressions reaching production.
- **Design-system-driven PDF.** Architected a PDF-generation service via API that reused the design system, keeping print and web visually coherent from a single source.

JAN 2019 – JUL 2019 BERLIN

## Senior Software Engineer

Sauce Labs

Owned the frontend integration between Sauce Labs' real-device cloud and the testing services from the acquired TestObject.

- **Real-device cloud migration.** Helped migrate legacy real-device-cloud infrastructure to a modern, scalable platform.
- **Integration architecture.** Drove frontend optimizations that smoothed the integration between devices and testing environments.
- **SDK automation & state layer.** Designed an SDK-automation process from Swagger definitions and built the state layer that synchronized microservice data with the frontend – streamlining API consumption and maintainability.

JUN 2017 – DEC 2018 BERLIN

## Senior Frontend Engineer

Getsurance

Built Getsurance's frontend from the ground up in *Elm* – a type-safe, crash-free foundation for a regulated insurance product – and the automation around it.

- **Component library from scratch.** Created a fully reusable UI component system that let the team ship new features with minimal effort.
- **Email infrastructure.** Developed a responsive transactional-email system (Inky & Panini) for consistent branding across communications.
- **Headless CMS.** Integrated a static-site generator with a headless CMS for efficient content management.

EARLIER

Across Loggi, Creditas, Dafiti, UOL, and Think4 (2010–2017, São Paulo → Berlin), I grew from building brand storefronts and high-conversion checkouts into shared component libraries and app architecture – React, Redux, Ember.js, and React Native – standardizing frontend practices and shipping the products and internal systems that scaled each company.

ARCHITECTURE & LEADERSHIP

Design systems · Frontend architecture

· Technical leadership · Cross-team alignment

· Platform migrations · API & contract design

LANGUAGES & FRAMEWORKS

TypeScript · JavaScript · Elm · React · React Native

· Redux · CSS

PERFORMANCE

CSS optimization · Build-time extraction

· Visual regression

SYSTEMS & TOOLING

Style Engines · Design tokens · MCP / AI-ready docs

· Icon pipelines · Component libraries
